CAPACITORS

IPC offers a complete line of metallized polypropylene capacitors, minimum weight and small package, for general A.C. applications with the highest quality.

For special customer designs, like different features or voltages up to 660 volts, please contact the factory with your specific requirement as we are specialized in custom made capacitors.

RUN CAPACITORS, SINGLE MOTORS AND LIGHTING EQUIPAMENT

Self regenerated dry type (important in internal short circuit break due to dielectric mal function). IPC capacitors come in aluminium case or polypropylene anti-flame case, hermetically sealed with poliuretano resin, with double terminals type Faston (quick plug) or cable, with low loss and high thermal stability.

COOLING SOLUTIONS WITH FASTON TYPE

IPC offers a complete line of metallized polypropylene capacitors, minimum weight and small package, for general A.C. applications with the highest quality. For special customer designs, like different features or voltages up to 660 volts, please contact the factory with your specific requirement as we are specialized in custom made capacitors.

THREE-PHASE CAPACITIVE UNITS

The Three-phase IPC Capacitive Units are formed by three elements (coil) produced with metallized polypropylene film and self regenerative, linked in a triangle and mounted in an aluminum pack. Incorporated discharge resistors mounted internally. M12 screw incorporated to the pack with included nut for capacitors setting in vertical and horizontal assembly. Wiring connector with terminals for quick connection type fast-on. Safety Device: The IPC capacitors are made with an internal safety device that is activated in the occurrences of overloads or in cases of internal overpressure, preventing risks of explosions and fire propagation. They can be supplied in 220, 380 and 440VAC.
